

SOFTWARE ENGINEERING LAB – 2

Name: Srijan

SRN: PES1UG24AM284

Problem Statement

As a database administrator, I want to monitor and analyze database queries to identify slow or inefficient queries so that I can improve query performance and optimize database response time.

Creating Epics and Stories

SELF-REFLECTION

1. Did your estimations reflect the actual effort?

Yes, the estimations reasonably reflected the relative effort required for the user stories. Stories involving more complex activities, such as query execution analysis and performance bottleneck detection, were assigned higher story points, while comparatively simpler tasks received lower points.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized according to the importance and impact of each task. Core database query analysis and performance-related tasks were given higher priority, ensuring that the most important functionality would be addressed first.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned workflow. The selected stories were moved from To Do → In Progress → Done, allowing the planned work to be tracked through the Scrum board. The sprint therefore provided a clear representation of how the planned tasks progressed toward completion.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart provided an overview of how quickly the remaining story points decreased during the sprint. It helped show the team's progress against the expected pace of completion and provided an indication of whether the team was on track.
